## Caring for Garden SP#TS

Check your sPOT every morning.

If the top ½ inch of soil is dry, give your plants a long, s-l-o-w drink of water.

In very hot weather, pots may need water twice a day.

2

**HOW TO WATER** 

Black NOT **Green** 

Water the black not the green.

Put your hose under plant leaves to water the soil not the foliage to discourage fungus growth. Water s-l-o-w-l-y to reach the deepest roots.

3 FEEDING

Your Garden sPOT has a slow-release fertilizer but in 3 months, it will need more food.

Either add water-soluble fertilizer every week, or more slow-release fertilizer that will last months.

(Follow package directions.)

4 PRUNING

Your Garden sPOT will be lush but, by mid-summer, plants may be too tall or dense to let in sun and air.

Cut out old flowers, leaves, and extra stems to keep your sPOT looking great!

Go to www.garden-spots.com to read about Care & Feeding and to sign up for our helpful newsletter. Check our blog and YouTube channel for videos on watering, fertilizing, and pruning techniques. You can always contact us at info@garden-spots.com or order our mid-summer tune up — we can prune, fertilize, and check your sPOT for problems.
