Caring for Garden SP#TS

Check your sPOT every morning.

If the top ½ inch of soil is dry, give your plants a long, s-l-o-w drink of water.

In very hot weather, pots may need water twice a day.

2

HOW TO WATER

Black NOT Green

Water the black not the green.

Put your hose under plant leaves to water the soil not the foliage to discourage fungus growth. Water s-l-o-w-l-y to reach the deepest roots.

3 FEEDING

Your Garden sPOT will need food.
Either add water-soluble fertilizer
every week, or more slow-release
fertilizer that will last months.
(Follow package directions.)

4 PRUNING

Your Garden sPOT will be lush but, by mid-summer, plants may be too tall or dense to let in sun and air.

Cut out old flowers, leaves, and extra stems to keep your sPOT looking great!
